

PROFESSIONAL SUMMARY:

Java Full Stack Engineer with 8 years of experience building scalable enterprise platforms using Java, Spring Boot, React.js, AWS, and GCP. Strong expertise in designing microservices, high-performance REST APIs, distributed systems, and cloud-native applications handling critical workloads. Extensive experience modernizing legacy systems, improving performance, implementing event-driven architectures with Kafka, and delivering secure React-based user experiences. Hands-on experience with CI/CD, Kubernetes, observability, and production-scale system reliability. Worked with AI-assisted development tools including Claude Code, Copilot, Amazon Q, and prompt engineering to improve delivery speed and code quality.

TECHNICAL SKILLS

Programming	Java, JavaScript, Typescript, Python
Frontend Technologies	React, Redux, HTML5, CSS3, Tailwind CSS, Bootstrap, Material UI, Angular, RxJS
Backend Development	Spring Framework, Spring Boot, Spring MVC, JDBC, JPA/Hibernate, Spring Security, REST APIs
Microservices & Architecture	Microservices Architecture, Event-Driven Systems, Reactive Programming
Streaming and Messaging	Apache Kafka, Kafka Streams
Databases	Oracle, MySQL, SQL Server, MongoDB, Postgres
Observability & Search	OpenSearch, Elasticsearch, Splunk, Grafana
Testing Frameworks	JUnit, Mockito, Spring Boot Test, Jest, Jasmine, Karma, API Testing (Postman, Swagger),
DevOps & CI/CD	Jenkins, GitHub Actions, Maven, Docker, Kubernetes, Terraform
Monitoring & Logging:	Prometheus, Grafana, Open Telemetry, ELK Stack (Elasticsearch, Logstash, Kibana)
Cloud & Deployment:	AWS, Azure, GCP, CI/CD Pipelines
GenAI / AI Engineering	OpenAI API, Gemini, Prompt Engineering, RAG, Vector Databases (Pinecone / FAISS), Embeddings
Tools	Git, Bit Bucket, Splunk JIRA, Spark, SonarQube, Confluence, IntelliJ, VSCode, Figma, Maven, Gradle, Rally
Agile Practices	Agile, Scrum, Backlog Grooming, Sprint Planning, Standups, Retrospectives
AI Tools	Claude Code, GitHub Copilot, Amazon Q Chat, Kiro, Prompt Engineering

PROFESSIONAL EXPERIENCE:

First Citizens Bank, Los Angeles, CA

Dec 2023 – present

Role: Sr. Software Developer

- Built and maintained Spring Boot microservices handling high-volume banking transactions, with focus on low-latency processing and data consistency across services
- Designed REST APIs for payments, transaction history, fraud checks, and downstream integrations consumed across multiple downstream systems
- Implemented Kafka-based async processing to decouple transaction handling and improve system throughput under peak load
- Solved real production bottlenecks by analyzing slow queries and adding indexes + query rewrites, cutting response times significantly for critical APIs

- Worked with Redis caching frequently accessed transaction data, reducing unnecessary DB hits during high traffic windows.
- Designed microservice architecture for transaction workflows, defining service boundaries, API contracts, and data flow across distributed systems
- Built React.js operational dashboards with reusable components, role-based access, real-time metrics, and transaction visibility.
- Integrated frontend with secure APIs using token interceptors, retry handling, and centralized error management.
- Ensured idempotent processing and data consistency across services handling financial transactions
- Worked with Elasticsearch for search-heavy use cases requiring fast filtering and querying.
- Deployed services on AWS (EC2/EKS) and worked closely with DevOps on containerization and pipeline issues
- Implemented retry logic and circuit breakers for unstable downstream systems instead of letting failures cascade
- Used CloudWatch logs and metrics heavily during production incidents to trace issues across services.
- Added Sonar checks and test coverage gates to prevent bad code from going into builds
- Used Claude Code and Copilot to accelerate Java/Spring Boot refactoring, generate unit test scaffolding, review edge cases, and improve developer productivity without bypassing code review standards.

Volkswagen, Rochester, Michigan

Feb 2022 - Nov 2023

Role: Software Developer

- Developed backend services using Spring Boot for vehicle lifecycle and operational workflow systems
- Built clean REST APIs with proper DTOs and validation, making it easier for frontend teams to consume without guesswork
- Used Spring Data JPA + Hibernate for managing relational data with proper transaction handling
- Fixed real performance issues by rewriting bad joins, adding indexes, and tuning queries on reporting-heavy tables
- Built React components using Hooks to visualize workflows, operational states, and service-level data
- Connected UI to backend using async calls and handled edge cases like partial failures and empty responses
- Reorganized service logic into distinct controller, service, and repository layers, improving maintainability and readability of backend code.
- Implemented pagination and server-side filtering to handle large datasets returned by operational reporting APIs.
- Added structured logging to trace request flows across service calls, simplifying debugging of production incidents.
- Developed JUnit and Mockito test suites validating business logic in service layers.

American Eagle Outfitters, Pittsburgh, PA

Jan 2020 - Feb 2022

Role: Software Developer

- Built reusable React.js components using JavaScript, improving user interaction and streamlining end-to-end application workflows.
- Implemented JWT-based authentication and authorization for protected API access across full-stack modules.
- Integrated Postgres for relational data processing and MongoDB for flexible document storage based on business use cases.
- Used Redis caching to improve high-frequency API performance and reduce repeated database hits.
- Integrated Elasticsearch to support fast search, filtering, and data retrieval across large application datasets.
- Managed code repositories through GitHub and Bitbucket, supporting team-based version control and release coordination.

- Built and supported CI/CD pipelines using GitHub Actions, enabling automated build, test, and deployment workflows.

iPrism Technologies, Hyderabad, India

July 2018 - Dec 2019

Role: Associate Software Developer

- Developed Java-based backend components contributing to core business logic and data processing modules.
- Supported frontend development using HTML, CSS, and JavaScript, helping build basic user interfaces and improve page responsiveness.
- Worked with JDBC and SQL queries to retrieve and update data from relational databases as part of application functionality.
- Participated in building and testing simple REST endpoints, gaining exposure to backend-to-frontend communication.
- Wrote unit test cases using JUnit to validate application functionality and reduce basic defects during development.
- Helped debug and fixed issues identified during development and testing, improving understanding of application flow and error handling.
- Participated in Agile meetings and code reviews, gaining exposure to software development best practices and team collaboration.

EDUCATION:

Master's in computer science – University of Houston-Clear Lake.
